Disclaimer

Seculite Solutions (Seculite) reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. Seculite do not cover testing or auditing the integration with external contracts or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

Seculite do not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analysed, nor do they provide any indication of the technology proprietors. Seculite should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

Seculite Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. Seculite’s position is that each company and individual are responsible for their own due diligence and continuous security. Seculite in no way claims any guarantee of the security or functionality of the technology we agree to analyse.

Project Engagement

During the Date of 16 January 2023, **CareBig Team** engaged Seculite to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Seculite with access to their code repository and whitepaper.

Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0

Level	Value	Vulnerability	Risk (Required Action)
Critical	9-10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
High	7-8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
Medium	4-6.9	vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
Low	2-3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
Informational	0-1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk.

Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
    a. Review of the specifications, sources, and instructions provided to Seculite to make sure we understand the size, scope, and functionality of the smart Contract.
    b. Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
    c. Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to Seculite describe.

2. Testing and automated analysis that includes the following:
    a. Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
    b. Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.

3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.

4. Specific, itemised, actionable recommendations to help you take steps to secure your smart contracts.

Used Code from other Frameworks/Smart Contracts (direct imports)

Imported Packages:

Dependency / Import Path	Count
@openzeppelin/contracts/token/ERC20/ERC20.sol	1
@openzeppelin/contracts/token/ERC20/extensions/ERC20Capped.sol	1
@openzeppelin/contracts/token/ERC20/extensions/ERC20Burnable.sol	1
@openzeppelin/contracts/security/Pausable.sol	1
@openzeppelin/contracts/access/AccessControl.sol	1

Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.

File Name	SHA-1 Hash
contracts/CareBigToken.sol	c1e71ee5c0092f3e5967a1368060fb7778b5a448

Scope of Work/Verify Claims

The above token Team provided us with the files that needs to be tested(GitHub, Bscscan, Etherscan, les, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Is contract an upgradeable
2. Correct implementation of Token standard
3. Deployer cannot mint any new tokens
4. Deployer cannot burn or lock user funds
5. Deployer cannot pause the contract
6. Deployer cannot set fees
7. Deployer cannot blacklist/antisnipe addresses
8. Overall checkup (Smart Contract Security)

Is contract an upgradeable

Name	Answer
Is contract an upgradeable?	No

Correct implementation of Token standard

ERC20				
Function	**Description**	**Exist**	**Tested**	**Verified**
Total Supply	Provides information about the total token supply	✓	✓	✓
BalanceOf	Provides account balance of the owner's account	✓	✓	✓
Transfer	Executes transfers of a specified number of tokens to a specified address	✓	✓	✓
TransferFrom	Executes transfers of a specified number of tokens from a specified address.	✓	✓	✓
Approve	Allow a spender to withdraw a set number of tokens from a specified account.	✓	✓	✓
Allowance	Returns a set number of tokens from a spender to the owner.	✓	✓	✓

Write functions of contract

V 1.0

- pause
- unpause
- mint
- mintAndLock
- airdrop
- blackListWallet
- removeWalletFromBlackList
- grayListWallet
- removeWalletFromGrayList
- recoverTokens

Deployer cannot mint any new tokens

V 1.0

Name	Exist	Tested	Verified
Deployer cannot mint	✓	-	✗
Max / Total Supply	12.000.000.000		

Comments

V 1.0

The wallet with the “MINTER” can mint new tokens.

Deployer cannot burn or lock user funds

Name	Exist	Tested	Verified
Deployer can lock	✓	✓	✗
Deployer cannot burn	✓	✓	✓

Comments

V 1.0

The wallets with the roles “MINTER”, and “GUARD” can lock user funds by:

- blacklisting addresses
- Locking a wallet for any amount of time and tokens because there are no limitations on the amount of tokens and the time period

Deployer cannot pause the contract

Name	Exist	Tested	Verified
Deployer cannot pause	✓	✓	✗

Comments

V 1.0

The wallets with the roles “PAUSER” can pause the contracts.

Deployer cannot set

Name	Exist	Tested	Verified
Deployer cannot set fees over 25%	-	-	-
Deployer cannot set fees to nearly 100% or to 100%	-	-	-

Deployer can blacklist/antisnipe addresses

Name	Exist	Tested	Verified
Deployer cannot blacklist/antisnipe addresses	✓	✓	✗

Comments

V 1.0

The wallets with the roles “GUARD” can blacklist addresses. Moreover, they can also “grayList” users in which an users account will be locked for a certain amount of time but the amount of time can be set to any arbitrary value, which means the “GrayList” addresses can also be blocked permanently.

Overall checkup (Smart Contract Security)

Modifiers and Public Functions

V 1.0

```
pause
onlyRole
unpause
onlyRole
mint
onlyRole
mintAndLock
onlyRole
airdrop
onlyRole
blackListWallet
onlyRole
removeWalletFromBlackList
onlyRole
grayListWallet
onlyRole
removeWalletFromGrayList
onlyRole
recoverTokens
onlyRole
```

Ownership/Authorised Addresses Privileges:

V 1.0

- There are several authorities which are authorized to call certain functions, that means, if the owner is renounced, another address is still authorized to call functions

- “MINTER” , and “GUARD” role can:
    - Airdrop tokens to any wallet at any point in time and the airdrop
    - tokens will be minted before being transferred
    - GUARD address can transfer any amount of tokens from whatever wallet they want. Thus, the function is named “RecoverTokens” but the actual functionality will allow the Authority wallet to transfer funds from any arbitrary user’s wallet to the wallet of their choosing

Please check if an OnlyOwner or similar restrictive modifier has been forgotten.

Source Units in Scope

V 1.0

File	Logic Contracts	Interfaces	Lines	nLines	nSOLC	Comment Lines	Complex. Score
Contracts/CareBigToken.sol	1	0	168	147	126	1	121
Total	1	0	168	147	126	1	121

Legend

V 1.0

Attribute	Description
Lines	total lines of the source unit
nLines	normalised lines of the source unit (e.g. normalises functions spanning multiple lines)
nSLOC	normalised source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

Audit Result

Critical issues

No critical issues

High issues

High risk found

Issue	File	Type	Line	Description
#1	CareBigToken.sol	Drain tokens from any address	157	The address with GUARD role can transfer funds from any wallet to any wallet because there is no restriction in place to check if the tokens are only being withdrawn from "Blacklisted" address. Due to the lack of checks, the function will allow the 'GUARD' address to drain tokens from all the user wallets without the need for approval because on L165 '_transfer' function is called directly which skips the approval check

Medium issues

No medium issues

Low issues

No low issues

Informational issues

No informational issues

Issue	File	Type	Line	Description
#1	CareBigToken.sol	NatSpec documentation missing	-	If you started to comment your code, also comment all other functions, variables etc.

Audit Comments

V 1.0

We recommend you to use the special form of comments (NatSpec Format, Follow link for more information https://docs.soliditylang.org/en/ latest/natspec-format.html) for your contracts to provide rich documentation for functions, return variables and more. This helps investors to make clear what that variables, functions etc. do.

SWC Attacks

ID	Title	Relationships	Status
SWC-136	Unencrypted Private Data On-Chain	CWE-767: Access to Critical Private Variable via Public Method	PASSED
SWC-135	Code With No Effects	CWE-1164: Irrelevant Code	PASSED
SWC-134	Message call with hardcoded gas amount	CWE-655: Improper Initialization	PASSED
